Date of Collection 17.7.14	Total Volume 3ml
Colour Milky	pH6.7
Motility 90% improves to 95% in 1st buffer	Progression 4/5
Pellet volume 0.25ml	Cream
Sperm count /ml 142 million	Total Count 426 million
Viable Count 404 million	
No Straws Frozen 6	Viable Sperm per straw 65 million
No Straws per Breeding Unit	2
Morphology	
% Abnormal	<2%
Abnormalities seen were minimal – a few broken tails and bent tails. No primary abnormalities	
Cellular Debris 8%	Rbc/Wbc x 400 Field 4 rbc
Post Thaw - straw G was tested and demonstrated great and rapid return of motility to 95% and 4/5	

Comment

A young male for semen collection and storage. He demonstrates good interest in the teaser, but is still relatively young and has not been used for matings. His overall count is expected to rise further.

Sperm were highly motile and progressive with good morphology and minimal abnormality. They behaved well during the freezing process and similarly woke up well during thaw.
2 straws minimum are needed per AI
